

1. I ask...

This paper investigates how readers verify AI-generated interpretations during long-form reading. It finds that **verification becomes difficult because evidence is disconnected...** Readers need to manually reconstruct the correspondence between the AI's explanation and the author's argument...

2. I use StructWeaver to find the entry point.

GIST (AI abstraction) VERBATIM (source evidence) SOURCE (paper)

Verification becomes difficult because evidence is disconnected.

Readers need to manually reconstruct the correspondence between the AI's explanation and the author's argument.

This separation changes how readers engage with the source.

"...readers had to manually **reconstruct the correspondence** between the AI's explanation and the author's argument, piece by piece."

"...the AI's logic, the author's logic, and the reader's prior knowledge are often different, making verification costly."

"StructWeaver externalizes these relationships so readers can inspect, question, and build on them."

Question

Add Link

...readers had to manually reconstruct the correspondence between the AI's explanation and the author's argument, piece by piece.

3. I continue the conversation.

But why does this separation matter?

When the AI's explanation and the author's argument are disconnected, readers must bridge the gap themselves, increasing cognitive load and the chance of incomplete or incorrect understanding.

Get it. Then how do readers repair this mismatch?

...

My conversation path emerges from what I've read.
