

A Source

Introduction

...This capability allows readers to quickly establish an initial understanding without reading every passage in detail. However, fluent summaries can also introduce a less visible problem: different AI-generated abstractions of the same document may foreground different arguments, contributions, or implications.

For example, when several LLMs summarize the same research paper, one may emphasize the evaluated system, another the observed user behavior, and another the broader design implications. None of these interpretations is necessarily factually incorrect, yet each directs the reader along a different interpretive path [1, 25, 36]. The challenge is therefore not only whether an AI-generated statement is correct, but whether readers can recover how a particular abstraction relates to the source material from which it was constructed [16, 22].

Existing AI-assisted reading systems have substantially improved how readers access and inspect long documents [2, 12, 20]...

B Gist

Same paper, different emphases

Different emphases shape different interpretive paths

Different does not necessarily mean incorrect

Different does not necessarily mean incorrect

C Verbatim

For example, when several LLMs summarize the same research paper, one may emphasize the evaluated system

another the observed user behavior, and another the broader design implications.

The challenge is therefore not only whether an AI-generated statement is correct, but whether readers can recover how a particular abstraction relates to the source material from which it was constructed [16, 22].

None of these interpretations is necessarily factually incorrect, yet each directs the reader along a different interpretive path [1, 25, 36].

proach prompt design?

In this work, we investigate how non-AI-experts intuitively approach prompt design when designing LLM-based chatbots, with an eye towards how non-AI-expert-facing design tools might help.
